The Solution:

Wireless metropolitan area networks are a perfect solution for linking many schools in a region. Because wireless systems can be installed simply and affordably relative to fiber optics, a service provider could afford to offer an inexpensive MAN to school districts at a monthly fee. Or, the school district could opt to own the infrastructure itself. Either way, wireless provides a viable solution for improving communications and sharing resources between many schools.

As an added benefit, the district could offer low or no-cost Internet access to households in the immediate vicinity to the schools. Using an inexpensive multipoint network or standard Wi-Fi technology, broadband access can be fanned out from the school.
